

You have purchased the best DVD writing hardware... what about the software?

Why blame the copied DVD that your player is refusing to recognize? Before you start breaking all the blank Medias out of frustration, please wait and think for some time. You might be thinking that the spindle of the best DVDs that you had purchased are not up to the mark. The replicated DVD that you had copied at your friend's place did not work.

Thinking that it might have been a fluke, you copied the same at your place itself, the end result was the same. Even this copy was not working. Before blaming the media used for making the copies, have you thought about the DVD copying software? There are a growing number of DVDs, especially those containing movies and games that are protected with special anti-copying routines.

According to the law, the owner of a copyrighted DVD has got rights to make a backup copy of the same, in case the original gets damaged or is misplaced. In spite of this the software companies encrypt the DVD with special codes that protects it from getting copied. The best DVD copying software should be able to circumvent these protections and make copies true to the original.

However, there are few such programs that can make a decent copy of the original. Every few months the software manufacturers come up with new protection routines and the cat and mouse game starts all over again. A decent DVD copy software manufacturer should release updated copies of their program within a few weeks of the new protection routine being incorporated.

Only the best are able to keep up with such a strenuous routine. Apart from just copying, good software should be adaptable to all the DVD burners available in the market and should incorporate drivers for them all. Different manufacturers use different burning routines for their DVD writing hardware. These are things that a good and reputed publisher takes care of.

They see to it that their DVD burning software works perfectly on all types of available burners. The problem for the general public arises when they plan to purchase good replicating software. There are so many of them available on the net and each one claims to be the best. At times it can become confusing to read the specifications of a few of them and then deciding which one to purchase.

One should be aware of an important point. All decent software manufacturers allow you to download a trial version of their program and test it for a certain period of time. Hence it is recommended that you download one of them and put it through its paces. If it meets your requirements, and burns all types of DVDs flawlessly, purchase them. Asking your computer savvy friend might also provide you with some tips when selecting software for DVD copying.
